

SCARIFYING AND RIPPING

Front mounted ripper-scarifiers are generally used for light work.

Some tips for using a ripper-scarifier:

1. Drive the grader in straight passes to create more traction with the attachment and the materials.
2. Use low gears and less rpms to avoid the tires slipping.
3. Only ever use the correct amount of shanks for the work task.
4. Slowly lower the shanks of the ripper-scarifier attachment into the materials while travelling straight.
5. Only use one ripper shank when ripping extremely hard materials.
6. Never use a single scarifier shank in hard materials.
7. Do not use badly worn or missing shank tips as this will damage the attachment.
