

LOADING THE GRADER

The transporter must be parked in a safe area on firm level ground with all park brakes and supporting jack in position.

The loading platform should be clear of all debris.

When loading the grader, the operator must line it up straight with the loading ramps and approach in low gear following the directions of the appointed guide.

As the machine is driven onto the float or trailer the operator should ensure blade is high enough to clear the pivot point of ramp or carrying platform.

LOADING THE GRADER

Once on the float the machine is driven forward as far as possible and the blade and rippers lowered.

The machine must be restrained by chains in a manner, which minimises its movements during transport.

The machine should be shut down with all brakes and locks applied.

Before moving it is important to secure the rain cap on the exhaust to prevent air being sucked down the exhaust and causing damage to the turbo.
