

TOOLS AND EQUIPMENT

Before carrying out any routine maintenance and minor repairs make sure you have all of the tools and equipment you will need to finish the job.

Maintenance activities could include:

Air filters.

Greasing or lubricating attachments.

Checking drum parts and replacing them as needed.

Battery checks.

Fuel and other fluids.

Refuelling.

Recording and reporting of faults through workplace procedures.

All tools and equipment must be kept in good working order. This means cleaning, checking, maintaining and storing them correctly, by following worksite procedures and manufacturers' guidelines.

While you are cleaning, check each item for damage or wear and tear. If anything is wrong report it, repair it, or have it fixed by a qualified person.
